## PROJECT PLANS

The project plans are as follows:

- SP-1 “Overall Site Plan”
- SP-2.1 to SP-2.2 “Layout and Landscape Plan”
- SP-3.1 to SP-3.2 “Grading and Utilities Plan”
- SP-4.1 “Overall Phasing Plan”
- SP-4.2 to SP-4.3 “Erosion and Sediment Control Plan”
- PR-1 “Profiles and Cross Sections”
- LP-1 “Lighting Plan”
- D-1 to D-5 “Details”

## 1.0 INTRODUCTION

### 1.1 Project Description

The subject project is a 44± acre parcel located along U.S. Route 6 in the Town of Southeast. The project parcel is located between Interstate 84 and U.S. Route 6. The attached location map (Figure 1) delineates the subject property and its surroundings. The subject parcel is located in the GC-2 zoning district and is designated as Tax Map Number 68.-2-48.

The subject project is located in the East Branch Reservoir Basin. The on-site ground cover is characterized as a mixture of woods and meadow throughout the majority of the site. The property ranges in elevation from a high point of 534 in the central portion of the site adjacent to the southern property line, to elevation 442, in the Town regulated wetland on the northeastern portion of the site. The slopes throughout the proposed project range from flat to generally steep slopes. Soil types on the property vary from very deep, well-drained soils to moderately drained soils. Figures 2 and 3 provide a breakdown of the soil types and a listing of these soils in accordance with the *Soils Survey of Putnam and Westchester Counties*.

Additional physical features of the property include two (2) Town-regulated wetlands. One (1) Town-regulated wetland is located in the northwestern portion of the site. An intermittent watercourse and reservoir stem are located within this Town-regulated wetland. The second Town-regulated wetland is located on the eastern portion of the site. Stormwater runoff from Interstate 84 is discharged to an unnamed stream that flows through the Town-regulated wetland on the eastern portion of the site. The unnamed stream crosses under U.S. Route 6 and discharges to the East Branch Reservoir Basin.

The subject property is proposed to be developed with approximately 184,800 s.f. of retail and 14,800 s.f. of office buildings and associated access roads, parking and landscaping. The development will include stormwater improvements, which will convey runoff to and through a series of stormwater management practices. The proposed practices will treat the stormwater runoff created by the development of the site.

There are no known enforcement actions, including lawsuits or administrative proceedings, commenced against the applicant, or any principle affiliate of the applicant, for any alleged violations of law related to the applicant of the site, in the five years preceding this application.

### 1.2 Existing Stormwater Runoff Conditions

The subject property is a mixture of woods and meadow throughout the property. Currently the stormwater runoff from the property flows overland from the high point in the central portion of the site along the southern property line to the Town-regulated wetlands. A ridge in the central portion of the property divides the flow of the stormwater runoff between the two (2) onsite Town-regulated wetlands. An un-named stream tributary to the East Branch Reservoir Basin passes through the eastern portion of the site and originates from the discharge of the stormwater runoff from Interstate 84. The un-named stream crosses under U.S. Route 6 and discharges in the East Branch Reservoir. An intermittent watercourse and reservoir stem are located in the Town-regulated wetland in the northwestern portion of the site. Ultimately the stormwater runoff drains to the East Branch Reservoir. A design line, and two design points were chosen to analyze the existing stormwater conditions of the site. The existing drainage area boundaries for the stormwater runoff can be seen on Figure 2.

### 1.3 Proposed Stormwater Runoff Conditions

The design line and points have been analyzed for the stormwater runoff produced from the proposed development of the property. The design line / points were chosen to analyze the stormwater runoff both qualitatively and quantitatively. Design Line 1 runs north to south along an existing wetland edge on the eastern portion of the property. Design Point 2 is located at the culvert in the Town-regulated wetland in the northwestern portion of the property. Design Point 3 is located at a culvert crossing north of US Route 6, and was analyzed to evaluate increases in impervious surfaces associated with the US Route 6 improvements. The design line / points are shown on Figure 3. The stormwater runoff from the proposed development will be collected and discharged to proposed stormwater management basins via a proposed stormwater collection system. Two (2) stormwater management basins and one (1) low gradient grass swale with check dams are proposed to treat stormwater for Design Line 1, three (3)

stormwater management basins and two (2) low gradient grass swales with check dams are proposed for Design Point 2, and one (1) stormwater management basin is proposed for Design Point 3. In general, the drainage patterns will remain the same from the existing conditions to the proposed conditions.

The proposed subsurface sewage treatment system (SSTS) for the bulk of development is located on the eastern portion of the site. This portion of the property is currently meadow, and will be maintained as meadow after construction. Thus, there is no change in land cover and this area will generate a zero net increase in peak flows and pollutant loadings at Design Line 1. As a result, the proposed Lot 2 SSTS area has been omitted from the stormwater quantity and quality analyses.

## 2.0 STORMWATER MANAGEMENT

The stormwater management for the subject project requires compliance with several regulatory agencies and codes. To meet the requirements of the New York City Department of Environmental Protection (NYCDEP), and the New York State Department of Environmental Conservation (NYSDEC) SPDES General Permit No. GP-0-08-001, several publications were referenced to design the stormwater management systems' quantity and quality components. The publications include *Reducing the Impacts of Stormwater Runoff from New Development*, April 1992 (Impacts), *Fundamentals of Urban Runoff Management: Technical and Institutional Issues* produced by the Terrene Institute, and the *New York State Stormwater Management Design Manual*, August 2003 (NYSSMM), including *Chapter 10, Enhanced Phosphorus Removal Standards*.

Water quality on this project has been addressed to meet the requirements of both the NYCDEP and NYSDEC. In order to address the water quality requirements of the NYSDEC, a series of stormwater management basins have been designed to capture and treat the volume of runoff generated by the 1-year 24-hour storm. To meet the water quality standards for the NYCDEP, the stormwater management basins have been designed in series to provide 24-hour plug flow detention of the 2-year 24-hour storm. In addition, to provide a final polishing of runoff, stormwater management basins 1.1P, 2.1P, and 2.2P will discharge to low gradient grass swales with check dams. Also incorporated into the Stateline Retail Center Stormwater Pollution Prevention Plan (SWPPP), but not modeled in the quantity / quality analyses are several adjunct practices. The intent of these practices, which includes rain gardens, pervious pavement, deep sump catch basins, and an irrigation system supplied by stormwater, is two fold. First the adjunct practices will further aid in water quality treatment, and secondly the adjunct practices will assist in maximizing the lifespan of the stormwater management system through Source Control and Better Site Design techniques.

To meet NYSDEC Stream Channel Protection requirements, 24-hour center of mass detention time of the 1-year, 24-hour storm event has been provided.

The stormwater management system has also been designed to attenuate post development peak flow rates from the 10 and 100-year storm events to predevelopment levels satisfying the NYSDEC requirements for Overbank and Extreme Flood Control.

### 2.1 Quantitative Analysis

The "HydroCAD" Stormwater Modeling System," by HydroCAD Software Solutions LLC of Tamworth, New Hampshire, was used to model and assess the stormwater flows for the subject project. HydroCAD is a computer-aided design program for modeling the hydrology and hydraulics of stormwater runoff. It is based primarily on hydrology techniques developed by the United States Department of Agriculture, Soil Conservation Service (USDA, SCS) TR-20 method combined with standard hydraulic calculations. The program was used to analyze the 1-year, 2-year, 10-year, 25-year and 100-year, 24-hour design storms. Peak flows were calculated for both the pre-development condition and the post-development condition. The input requirements for the HydroCAD computer program are as follows:

#### Subcatchments (contributing watershed/sub-watersheds)

- Design storm rainfall in inches
- CN (runoff curve number) values which are based on soil type and land use/ground cover
- Tc (time of concentration) flow path information

#### Stormwater Management Basins

- Surface area at appropriate elevations

- Flood elevation
- Outlet structure information

The following is a general description of the input data used to calculate the pre- and post-development stormwater runoff values. For detailed information for each subcatchment and pond, see Appendices A & B.

The precipitation values for the various design storms analyzed were obtained from the local County Soil and Water Conservation District office and the Northeast Regional Climate center. The values provided are for 24-hour design storms in the project locale.

<b>Design Storm</b>	<b>24-Hour Rainfall</b>
1-Year	3.2"
2-Year	3.5"
10-Year	5.5"
25-Year	6.0"
100-Year	10.0"

The CN (runoff curve number) values utilized in this report were referenced from the USDA, SCS publication *Urban Hydrology for Small Watersheds*. The following is a summary of the various land uses/ground covers and their associated CN values utilized in this report.

<b>Land Use/Ground Cover</b>	<b>CN Value</b>
Woods, A Soil	30
Woods/Grass, A Soil	32
Meadow, A Soil	30
>75% Grass Cover, A Soil	39
Urban Commercial, 85% Imp, A Soil	89
Woods, C Soil	70
Woods/Grass, C Soil	72
Meadow, C Soil	71
>75% Grass Cover, C Soil	74
Urban Commercial, 85% Imp, C Soil	94
Paved Parking and Roofs	98
Pervious Pavement	70

The hydrologic soils groups for the majority of the project consist of mainly A and C soils. The soils on the site consist of Chatfield – Charlton complex (CsD), Fredon silt loam (Fr), Knickerbocker fine sandy loam (KnB, KnC), Leicester loam (LcB), Paxton fine sandy loam (PnB, PnC), Ridgebury loam (RgB) and Sun loam (Sh).

The quantitative analysis performed for the subject project involves the assessment of a design line and two design points as shown on Figure 2 and Figure 3. Design Line 1 represents the western edge of the Town Regulated Wetland and evaluates the effects the proposed development of the site may have on the adjacent wetland while minimizing the amount of off site area accounted for in the analysis. Design points 2 and 3 represent culvert crossings to which portions of the site discharge too. There are two

existing drainage ditches located along the south side of US Route 6 to which the majority of the Design Line 1 and Design Point 2 drain to. It should be noted, the tributary areas to these two drainage ditches will be significantly reduced in the post-development scenario as a result of diverting runoff to the stormwater management basins. Based on the reduction in tributary area combined with the fact the post-development peak flows have been attenuated to pre-development levels at Design Line 1/Design Point 2, the capacity in the existing drainage ditches will be adequate to accommodate the proposed flows.

The only developed portion of the site not modeled in the quantitative/qualitative analysis is the eastern SSTS area. This is because the land area is currently maintained as meadow, and will remain as meadow upon project completion. Therefore, no change in land cover is proposed, and subsequently no change in the pre to post-development curve number will occur. Also the minor regrading proposed in the SSTS area will not effect the time of concentration. As there is no change in curve number or the time of concentration, there will be no change between the pre-development and post-development quantity/quality values. The following table summarizes the calculated pre-development and post-development peak stormwater runoff flows at the design line / points:

#### PEAK FLOW SUMMARY (C.F.S.)

<b>24-HOUR DESIGN STORM</b>								
	2-YEAR		10-YEAR		25-YEAR		100-YEAR	
	Pre	Post	Pre	Post	Pre	Post	Pre	Post
Design Line 1	0.21	0.21	4.77	3.47	7.05	4.94	35.35	27.64
Design Point 2	9.00	6.76	27.97	20.79	33.37	25.76	81.12	77.67
Design Point 3	0.60	0.19	3.12	1.27	3.94	1.74	11.80	10.48

As seen in the table above, the post development peak flows at Design Line 1, Design Point 2, and Design Point 3 have been attenuated to equal or less than predevelopment levels.

#### 2.2. Qualitative Analysis

Estimates of pre-development and post-development discharges of BOD, TP, TN, and TSS have been calculated for the subject project. The pollutant loading coefficient method was utilized to calculate the annual export of the above-mentioned pollutants. The New York State Department of Environmental Conservation (NYSDEC) publication *Reducing the Impacts of Stormwater Runoff from New Development* was referenced to determine appropriate loading rates for BOD. The publication *Fundamentals of Urban Runoff Management: Technical and Institutional Issues* produced by the Terrene Institute was referenced to determine appropriate loading rates for TP, TN and TSS. The appropriate loading rates were then utilized to calculate the annual pollutant export values. Variables involved with this calculation include soil type and land use/ground cover characteristics. The following table summarizes the pollutant loading rates utilized for the subject project.

**SUMMARY OF POLLUTANT LOADING RATES (LBS/ACRE/YEAR)**

Land Use/Ground Cover	BOD	TP	TN	TSS
Forest	7.0	0.10	1.8	76.5
Pasture	32.0	0.11	3.7	305.3
Grass	6.0	0.12	3.7	308.0
Commercial	163.0	0.71	4.6	716.5
Road	113.0	0.98	2.1	446.8

The primary treatment for stormwater runoff discharging from the subject project will be six (6) stormwater basins. For the commercial development on the eastern portion of the property two sets of stormwater basins (4 total) are proposed. In addition to the two sets, another stormwater basin located on the western portion of the property has been designed to treat runoff from the proposed office on Lot #1. Finally, a sixth stormwater basin is proposed north of the site to treat runoff associated with the proposed improvements to US Route 6. Stormwater runoff from all the stormwater basins proposed south of US Route 6 will be directed to the existing drainage ditches along US Route 6. In order to provide a final polishing of runoff these ditches will be converted into low gradient grass swales with stone check dams. In addition to providing a final polishing to the runoff discharged from the stormwater management basins, the low gradient grass swales with stone check dams will also provide treatment for approximately 0.5 acres of impervious surfaces associated with the western site entrance on Lot #2, and the site entrance on Lot #1.

The following pollutant removal efficiencies are referenced from the publication *Reducing the Impacts of Stormwater Runoff from New Development*, prepared by the NYSDEC.

**LONG TERM POLLUTANT REMOVAL EFFICIENCIES**

Treatment Method	BOD	TP	TN	TSS
Grass Swale	20%-40%	20%-40%	20%-40%	20%-40%
Design 2 Extended Detention Pond	40%-60%	40%-60%	20%-40%	80%-100%

The following table summarizes the estimated pre-development and post-development annual pollutant loads (calculated in Appendix C) calculated for the subject project.

**ANNUAL POLLUTANT SUMMARY TO DESIGN LINE 1**

	Annual Loads (lb/yr)			
	BOD	TP	TN	TSS
<b>Pre-Development Annual Pollutant Loads</b>	442.8	2.69	51.5	3808.9
<b>Post-Development Annual Pollutant Loads</b>	650.1 to 265.7	3.48 to 1.69	44.5 to 25.0	1092.5 to 648.6

**ANNUAL POLLUTANT SUMMARY TO DESIGN POINT 2**

	Annual Loads (lb/yr)			
	BOD	TP	TN	TSS
<b>Pre-Development Annual Pollutant Loads</b>	237.1	2.10	34.8	2072.7
<b>Post-Development Annual Pollutant Loads</b>	441.9 to 255.0	2.74 to 1.88	35.4 to 25.9	1906.2 to 1493.1

**ANNUAL POLLUTANT SUMMARY TO DESIGN POINT 3**

	Annual Loads (lb/yr)			
	BOD	TP	TN	TSS
<b>Pre-Development Annual Pollutant Loads</b>	174.1	1.61	7.5	847.8
<b>Post-Development Annual Pollutant Loads</b>	107.4 to 74.4	1.01 to 0.71	6.3 to 5.2	241.5 to 91.8

As seen in the previous summaries, the post-development pollutant loads are within or below the range of the pre-development loads for the pollutants of concern as required by the NYCDEP regulations in all instances with one exception, BOD at Design Point 2. Relative to the exception, the receiving watercourses and wetlands associated with Design Point 2 are large enough to assimilate the minimal increase in the BOD discharging from the site. With respect to phosphorus, which is the pollutant of concern in the subject watershed (East Branch Reservoir), the SWPPP for the project has been designed in accordance with the *Enhanced Phosphorus Removal Standards*. Through compliance with the *Enhanced Phosphorus Removal Standards* it is expected to achieve better than the calculated mean removal efficiencies, however no additional credit was taken in the stormwater treatment calculations. In order to ensure optimum pollutant removal efficiencies are maintained several adjuncts not incorporated into the stormwater quality analysis are proposed at the site. These adjuncts include low gradient grass swales with check dams to further polish runoff; catch basins with deep sumps, sections of pervious pavement, an irrigation system supplied by stormwater runoff (will periodically decrease runoff flows), and rain gardens. The project will therefore not impact the Town of Southeast's ability to achieve the established East Branch Reservoir TMDL, and the SWPPP does propose stormwater measures to reduce phosphorus loading to the maximum extent practicable.

The burden for reducing current phosphorous loading to achieve the TMDL presently lies with the Town of Southeast and its regional partners. The program for phosphorous reduction has been established in the NYSDEC document entitled *Croton Watershed Phase II Phosphorous TMDL Nonpoint Source Implementation Plan* (TMDL Implementation Plan) dated January 14, 2009. This plan clearly states that for simplicity and ease of local government administration the plan is largely structured to use existing programs to achieve reductions. These programs include:

- Potential additional point source reductions.
- NYSDEC SPDES General Permit for Stormwater Discharges for Municipal Separate Stormwater Sewer Systems (MS4s) Permit No. GP-0-08-002.
- State and regional source control and agricultural programs.
- US EPA Filtration Avoidance Determination Program.
- Putnam County "Croton Plan".

- NYCDEP “Croton Strategy”.
- NYCDEP EOH Water Quality Investment Funds, including the Putnam County Septic Repair Program.
- New York State non point source programs.
- NYSDEC – NYCDEP Coordinated Stormwater Enforcement Protocol.

The subject project is consistent with the TMDL Implementation Plan and applicable portions of the above-cited programs.

The NYSDEC SPDES General Permit GP-0-08-001 requires that the Water Quality Volume (WQ<sub>v</sub>) be treated in order to provide pollutant removal. Since the project is located in the NYC East-of-Hudson Watershed treatment of the Water Quality Volume is intended to improve water quality by capturing and treating the 1-year, 24-hour design storm runoff volume. The water quality volume is directly related to the amount of impervious cover proposed on the project area. Stormwater management basins will be utilized to meet the NYSDEC water quality treatment requirements. Stormwater management basins 1.0P and 1.1P, will be designed as P-1 Micropool Extended Detention Pond as defined in the *NYS Stormwater Management Design Manual*. Stormwater management basins 2.0P, 2.2P and 3.0P will be designed as W-4 Pocket Wetlands as defined in the *NYS Stormwater Management Design Manual*.

In order to provide further water quality treatment as required by the NYCDEP stormwater management basins 2.1P has been placed in series with stormwater management basins 2.0P. This stormwater management basin has been designed as a Design 2 Extended Detention Pond as outlined in *Reducing the Impacts of Stormwater Runoff from New Development*. 2.1P has been located second in the treatment series to allow the settlement of suspended particles in the preceding permanent pool of 2.0P.

### **3.0 STORMWATER CONVEYANCE SYSTEM**

The stormwater conveyance systems for the project consist of drain inlets, catch basins and HDPE pipe. The systems will be sized utilizing the Rational Method. The Rational Method is a standard method used by engineers to develop flow rates for sizing conveyance systems. The Rational Method calculates flows based on a one-hour design storm. In accordance with the Town of Southeast *Road and Drainage Specifications*, the conveyance systems have been sized to convey, at a minimum, the 10-year design storm. Refer to Appendix F for sizing calculations.

It should be noted that all drains anticipated to intercept groundwater are to be piped separately from the stormwater collection system. Particularly this applies to the drains associated with the retaining walls south of the proposed buildings and located in cut slopes. For the retaining walls proposed in the northern portion of the site adjacent to US Route 6, groundwater is not anticipated to be intercepted. This is because these walls are to be located in fill sections. Weep holes will be provided in the northern retaining walls minimizing unnecessary piping and disturbance.

### **4.0 EROSION AND SEDIMENT CONTROL**

Erosion and sediment control will be accomplished by three basic principles: containment of sediment, treatment of dirty water, and stabilization of disturbed areas. Sediment will be contained with the use of silt fence at the toe of disturbed slopes and excavation of temporary sediment basins. Disturbed areas will be permanently stabilized within 14 days of final grading to limit the required length of time that the temporary facilities must be utilized.

#### **4.1 Temporary Erosion and Sediment Control Facilities**

Temporary erosion and sediment control facilities will be installed and maintained as required to reduce the impacts to off-site properties. In general, the following temporary methods and materials will be used to control erosion and sedimentation from the project site:

- Stabilized Construction Entrance
- Silt Fence Barriers
- Stone Check Dams
- Storm Drain Inlet Protection

- Sediment Traps

A stabilized construction entrance will be installed at the entrances to the site as shown on the plan. The design drawings will include details to guide the contractor in the construction of this entrance. The intent of the stabilized construction entrance is to prevent the “tracking” of soil from the site. Dust control will be accomplished with water sprinkling trucks if required. During dry periods, sprinkler trucks will wet all exposed earth surfaces as required to prevent the transport of air-borne particles to adjoining properties.

Siltation barriers constructed of geosynthetic filter cloth will be installed liberally at the toe of all disturbed slopes. The intent of these barriers is to contain silt and sediment at the source and inhibit its transport by stormwater runoff. The siltation barriers will also help reduce the rate of runoff by creating numerous filters through which the stormwater must pass. Siltation barriers will also be installed around catch basins and drain inlets. The intent of these barriers is to prevent silt and sedimentation from entering the stormwater collection system.

The stormwater management basins will also act as temporary sediment traps during construction of the proposed building pad and utilities. Most stormwater runoff from disturbed areas will be directed to the traps. These traps will be sized in accordance with the publication, *New York Standards and Specifications for Erosion & Sediment Control*, printed by the Empire State Chapter Soil and Water Conservation Society.

In addition to the temporary sediment and erosion control measures listed above, pollution prevention measures on the site will also be accomplished by the use of a dumpster. All waste and scrap building materials on site shall be disposed of in the dumpster, with no waste being buried or improperly discarded. The site should be cleaned daily of all site litter and construction debris. Portable toilets will be provided on site during construction for wastemanagement. No construction chemicals are anticipated to be used or stored on site during and after construction.

#### 4.2 Permanent Erosion and Sediment Control Facilities

Permanent erosion and sediment control will be accomplished by diverting stormwater runoff from steep slopes, controlling/reducing stormwater runoff velocities and volumes, and vegetative and structural surface stabilization. All of the permanent facilities are relatively maintenance free and only require periodic inspections.

The temporary sediment traps will be cleaned of all sediment and debris, excavated to their final elevations and dimensions and stabilized with the vegetation as indicated on the plans. Rip rap aprons will be used at the discharge end of all piped drainage systems. Runoff velocities will be reduced to levels that are non-erosive to the receiving waterbodies through use of these aprons.

Other than the actual buildings and driveway surfaces, the primary method for permanently stabilizing disturbed surfaces at the subject site is with vegetation. The vegetation will control stormwater runoff by preventing soil erosion, reducing runoff volume and velocities, and providing a filter medium. Permanent seeding should optimally be undertaken in the spring from March 21<sup>st</sup> through May 20<sup>th</sup> and in late summer from August 15<sup>th</sup> to October 15<sup>th</sup>. The stormwater basins will allow for settlement of suspended sediment that is generated by stormwater runoff from the site. These facilities provide a central collection area for sediment deposition and eventual disposal.

### 5.0 MAINTENANCE AND IMPLEMENTATION

#### 5.1 Construction Phase

Details associated with the implementation and maintenance of the proposed stormwater facilities and erosion control measures during construction will be shown on the project plans. A construction sequence will be provided to guide the contractor in the installation of the erosion control measures as well as the site plan features. The erosion control plan includes associated details and notes to aid the contractor in implementing the plan.

During construction, a Site Log Book is required to be kept per NYSDEC SPDES General Permit GP-0-08-001. Erosion and sediment control inspections are required to be conducted once a week, and an updated logbook is required to be kept on site for the duration of the construction activities. The Construction Site Log Book is an appendix taken from the *New York Standards and Specifications for Erosion and Sediment Control* (Blue Book).

The stormwater management basins have been designed to limit the routine maintenance requirements. Initially the basins will require regular maintenance until the permanent vegetation is established. Permanent vegetation is considered established when 80% of the final plant density is established. Vegetation should be inspected every 30 days and after every major storm event until established, after which inspections should take place on a quarterly basis and after every large storm event. Damaged areas should be immediately re-seeded and re-mulched. The floor of the ponds will be planted with a seed mixture that contains plants tolerant of occasional flooding. The seed mixtures contain several plant species that vary slightly in their needs for survival. It is expected that not all of the species will survive due to variations within each basin such as water, nutrients, and light. During the initial year of planting, the plants may require watering to germinate and become established. Note that several seedlings may be required during the first year to completely establish vegetation within the ponds. After the initial year of establishment, the ponds do not need to be fertilized or watered. A natural selection process will occur over the first few years, such that the species within the seed mixture most suitable to the conditions will survive.

## 5.2 Long Term Maintenance Plan

The stormwater facilities for the subject project have been designed to minimize the required maintenance. This section discusses the minimum maintenance requirements to insure long term performance of the stormwater facilities. Initially the stormwater facilities will require an increased maintenance and inspection schedule until all portions of the site are stable. Generally the stormwater facilities consist of either collection/conveyance components or treatment components.

The stormwater collection and conveyance systems are composed of concrete drain inlets with cast iron frames and grates, and high-density polyethylene pipe. Minimal maintenance is typically required for these facilities. Each spring the paved areas will be cleaned to remove the winter's accumulation of traction sand. After this is completed, all catch basin sumps will be cleaned. All pipes will be checked for debris and blockages and cleaned as required. During the cleaning process, the catch basins and pipes will be inspected for structural integrity and overall condition; repairs and/or replacement will be made as required.

Once the desired vegetative cover is established in the ponds, only limited maintenance is required. The basins and outlet structures should be inspected after major storm events and semi-annually. During the inspections, the following should be checked:

- Evidence of clogging of outlet structure.
- Erosion of the flow path through the pond.
- Subsidence, erosion, cracking or tree growth on the embankment/berm.
- Condition of the emergency spillway.
- Accumulation of sediment around the outlet structure.
- Adequacy of upstream/downstream channel erosion control measures.
- Erosion of the basin bed and banks.
- Sources of erosion in the contributory drainage, which should be stabilized.

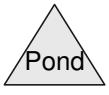

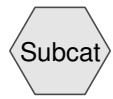

Access to the ponds will be through stabilized pond accesses. The accesses are proposed to be graded to final grades and seeded and mulched in accordance with the Erosion & Sediment Control Notes. The graded pond accesses and the side slopes and berms of the ponds should be mowed annually to prevent the establishment of woody plants within the swales, accesses, or pond berms. The bottoms of the ponds should not be mowed. During the mowing operations, debris and litter should be removed from all parts of the swales, accesses, and ponds. Accumulated sediment is anticipated to need to be removed from the swales and ponds approximately every 10 to 20 years, or when 50 percent of their capacity has been reached.

In addition to the guidelines specified above all operation, maintenance, management, and inspections of the stormwater management basins shall be performed in accordance with the *Maintenance, and Management Checklists* printed in the *New York State Stormwater Management Design Manual*, and contained in Appendix D of this SWPPP.

**Summary for Subcatchment 3.0S:**

Runoff = 9.30 cfs @ 12.19 hrs, Volume= 0.839 af, Depth= 5.30"

Runoff by SCS TR-20 method, UH=SCS, Time Span= 0.00-400.00 hrs, dt= 0.05 hrs  
Type III 24-hr 100 YEAR Rainfall=10.00"

Area (ac)	CN	Description
0.900	98	Paved parking & roofs
0.800	30	Woods, Good, HSG A
0.200	39	>75% Grass cover, Good, HSG A

1.900	63	Weighted Average
1.000		Pervious Area
0.900		Impervious Area

Tc (min)	Length (feet)	Slope (ft/ft)	Velocity (ft/sec)	Capacity (cfs)	Description
0.2	10	0.0100	0.69		<b>Sheet Flow,</b> Smooth surfaces n= 0.011 P2= 3.50"
6.5	90	0.0400	0.23		<b>Sheet Flow,</b> Grass: Short n= 0.150 P2= 3.50"
6.4	270	0.0200	0.71		<b>Shallow Concentrated Flow,</b> Woodland Kv= 5.0 fps
13.1	370	Total			

**Subcatchment 3.0S:****Hydrograph**

**Stateline Retail Center Post-development 040809**

Type III 24-hr 100 YEAR Rainfall=10.00"

**Summary for Pond 1.0P:**

Inflow Area = 12.500 ac, 72.08% Impervious, Inflow Depth = 8.03" for 100 YEAR event  
 Inflow = 117.00 cfs @ 12.06 hrs, Volume= 8.364 af  
 Outflow = 71.41 cfs @ 12.16 hrs, Volume= 8.327 af, Atten= 39%, Lag= 6.0 min  
 Primary = 71.41 cfs @ 12.16 hrs, Volume= 8.327 af

Routing by Dyn-Stor-Ind method, Time Span= 0.00-400.00 hrs, dt= 0.05 hrs  
 Starting Elev= 473.00' Surf.Area= 21,200 sf Storage= 38,250 cf  
 Peak Elev= 475.83' @ 12.16 hrs Surf.Area= 37,997 sf Storage= 121,916 cf (83,666 cf above start)  
 Flood Elev= 476.00' Surf.Area= 39,000 sf Storage= 128,350 cf (90,100 cf above start)

Plug-Flow detention time= 706.2 min calculated for 7.449 af (89% of inflow)  
 Center-of-Mass det. time= 572.2 min ( 1,356.2 - 783.9 )

**Operation, Maintenance, and Management**  
**Inspection Checklists**

**Pervious Pavement Operation, Maintenance and Management Inspection Checklist**

Project: \_\_\_\_\_

Location: \_\_\_\_\_

Site Status: \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

Inspector: \_\_\_\_\_

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>1. Pavement Surface (Monthly, After Major Storms)</b>		
1. Ensure that paving area is clean of debris		
2. Ensure that paving deters between storms		
3. Ensure that the area is clean of sediment		
4. Vacuum sweep to keep surface clear (3 to 4 times a year)		
5. Inspect the surface for deterioration or spalling (annual)		
<b>2. Adjacent Areas (As Needed)</b>		
1. Mow upland and adjacent areas, and seed bare areas		

**Rain Garden Operation, Maintenance and Management Inspection Checklist**

Project: \_\_\_\_\_

Location: \_\_\_\_\_

Site Status: \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

Inspector: \_\_\_\_\_

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>1. Plant Maintenance (Monthly, After Major Storms)</b>		
1. Ensure vegetation is healthy		
2. Remove and replace diseased / dead vegetation		
3. Ensure adequate layer of mulch present		
4. Remove invasive species and/ or weeds		
5. Ensure raingarden dewater between storms		

**Stormwater Pond/Wetland Operation, Maintenance and  
Management Inspection Checklist**

Project: \_\_\_\_\_

Location: \_\_\_\_\_

Site Status: \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

Inspector: \_\_\_\_\_

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>1. Embankment and emergency spillway (Annual, After Major Storms)</b>		
1. Vegetation and ground cover adequate		
2. Embankment Erosion		
3. Animal Burrows		
4. Unauthorized planting		
5. Cracking, bulging, or sliding of dam		
a. Upstream face		
b. Downstream face		
c. At or beyond toe		
downstream		
upstream		
d. Emergency spillway		
6. Pond, toe & chimney drains clear and functioning		
7. Seeps/leaks on downstream face		
8. Slope protection or riprap failure		
9. Vertical/horizontal alignment of top of dam "As-Built"		
10. Emergency spillway clear of obstructions and debris		
11. Other (specify)		

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>2. Riser and principal spillway (Annual)</b>		
Type: Reinforced concrete _____		
Corrugated pipe _____		
Masonry _____		
1. Low flow orifice obstructed		
2. Low flow trash rack.		
a. Debris removal necessary		
b. Corrosion control		
3. Weir trash rack maintenance		
a. Debris removal necessary		
b. Corrosion control		
4. Excessive sediment accumulation insider riser		
5. Concrete/masonry condition riser and barrels		
a. cracks or displacement		
b. Minor spalling (<1")		
c. Major spalling (rebars exposed)		
d. Joint failures		
e. Water tightness		
6. Metal pipe condition		
7. Control valve		
a. Operational/exercised		
b. Chained and locked		
8. Pond drain valve		
a. Operational/exercised		
b. Chained and locked		
9. Outfall channels functioning		
10. Other (specify)		
<b>3. Permanent Pool (Wet Ponds) (monthly)</b>		
1. Undesirable vegetative growth		
2. Floating or floatable debris removal required		
3. Visible pollution		
4. Shoreline problem		
5. Other (specify)		

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>4. Sediment Forebays</b>		
1. Sedimentation noted		
2. Sediment cleanout when depth < 50% design depth		
<b>5. Dry Pond Areas</b>		
1. Vegetation adequate		
2. Undesirable vegetative growth		
3. Undesirable woody vegetation		
4. Low flow channels clear of obstructions		
5. Standing water or wet spots		
6. Sediment and/or trash accumulation		
7. Other (specify)		
<b>6. Condition of Outfalls (Annual, After Major Storms)</b>		
1. Riprap failures		
2. Slope erosion		
3. Storm drain pipes		
4. Endwalls/Headwalls		
5. Other (specify)		
<b>7. Other (Monthly)</b>		
1. Encroachment on pond, wetland or easement area		
2. Complaints from residents		
3. Aesthetics		
a. Grass growing required		
b. Graffiti removal needed		
c. Other (specify)		
4. Conditions of maintenance access routes.		
5. Signs of hydrocarbon build-up		
6. Any public hazards (specify)		
<b>8. Wetland Vegetation (Annual)</b>		
1. Vegetation healthy and growing  Wetland maintaining 50% surface area coverage of wetland plants after the second growing season.  (If unsatisfactory, reinforcement plantings needed)		

*Stateline Retail Center —Stormwater Pollution Prevention Plan*

---

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
2. Dominant wetland plants  Survival of desired wetland plant species  Distribution according to landscaping plan?		
3. Evidence of invasive species		
4. Maintenance of adequate water depths for desired wetland plant species		
5. Harvesting of emergent plantings needed		
6. Have sediment accumulations reduced pool volume significantly or are plants “choked” with sediment		
7. Eutrophication level of the wetland		
8. Other (specify)

## **Grass Lined Swales Operation, Maintenance, and Management Inspection Checklist**

Project: \_\_\_\_\_

**Location:** \_\_\_\_\_

Site Status: \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

Inspector: \_\_\_\_\_

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>1. Debris Cleanout</b> <b>(Monthly)</b>		
Contributing areas clean of debris		
<b>2. Check Dams or Energy Dissipaters (Annual, After Major Storms)</b>		
No evidence of flow going around structures		
No evidence of erosion at downstream toe		
Soil permeability		
Groundwater/bedrock		
<b>3. Vegetation</b> <b>(Monthly)</b>		
Mowing done when needed		
Minimum mowing depth not exceeded		
No evidence of erosion		
Fertilized per specification		
<b>4. Sediment deposition</b> <b>(Annual)</b>		
Clean of sediment

**Irrigation System Operation, Maintenance and Management Inspection Checklist**

Project: \_\_\_\_\_

Location: \_\_\_\_\_

Site Status: \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

Inspector: \_\_\_\_\_

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>1. Irrigation System Components (Semi-Annually, After Major Storms)</b>		
1. Ensure roof catchment does not contain particulate matter		
2. Ensure no leaks or obstruction present in roof drain system		
3. Clean accumulated sediment in preceding sediment tank		

**Deep Sump Catch Basin Operation, Maintenance and Management Inspection Checklist**

Project: \_\_\_\_\_

Location: \_\_\_\_\_

Site Status: \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

Inspector: \_\_\_\_\_

Maintenance Item	Satisfactory/ Unsatisfactory	Comments
<b>1. Catch Basin (Semi-Annually, After Major Storms)</b>		
1. Inspect for damage to cast iron grate and frame		
2. Inspect for damage around pipe inlets / outlets		
3. Clean accumulated sediment in sump		

## **APPENDIX E**

### **Sediment Trap With Optional Dewatering Device Sizing Calculations**

3,600 CF minimum of storage required for each acre of contributing area

<b>Sediment Basin #</b>	<b>Contributing Area</b>	<b>Minimum Volume Required</b>	<b>Volume Provided*</b>	
1.0P	12.5 AC	45,000 CF	61,034 CF	From Elev. 468.00 To Elev. 473.90
1.1P	15.3 AC	55,080 CF	71,374 CF	From Elev. 452.00 To Elev. 455.90
2.0P	5.1 AC	18,360 CF	35,313 CF	From Elev. 478.00 To Elev. 480.10
2.1P <sup>1</sup>	5.9 AC	21,240 CF	25,937 CF	From Elev. 472.00 To Elev. 477.00
2.2P	2.1 AC	7,560 CF	7,753 CF	From Elev. 471.00 To Elev. 472.50

<sup>1</sup> Weirs to be blocked during construction.

\*NOTE: Volume provided is calculated from elevation indicated above, to the proposed weir height, except where indicated. These elevations may be modified during construction based on actual groundwater elevations encountered. If modifications are necessary, the volume of the proposed sediment basin shall not be less than the minimum required.

## **APPENDIX F**
